The lab wants to be sure we choose the correct method. 8290 is equivalent to 1613 and does see in the ppt to ppq range. However, D/F analysis is not great for running dilutions. So if we go 8290 and the samples are contaminated, they are saying the data would not be very usable. So the question is do they expect to see D/F out there. We're there drums of chlorinated materials that are leading them to D/F analysis.

If we expect contamination, they said 8280 is more appropriate. I am getting RLs and pricing for both.

I am going to a lunch mtg. Text me if you need anything!

Question from Delgado:

DL need to be 10 part per trillion or less, can they meet.

Would be for every sample submitted to date.

What is the cost for the quickest TAT, what is that TAT.

Will give notice to proceed, don't start yet.
